<https://alexsidorenko.com/blog/react-render-always-rerenders/>

Considering React, what is one-way, or unidirectional data flow? Why is it important?

Unidirectional data flow means data can only travel one way. You can only send data from parent to child via props. It is more efficient and easier to debug.

When does a React component render?

A component renders when it's imported and used in the DOM. In order for it to be imported it has to be exported from its file.
